

Water Guide

A QUICK GUIDE TO POOL WATER SYSTEMS

Chlorine

Traditional chlorine pools are the easiest and most cost-effective way to kill bacteria, but they do have some drawbacks, including a stronger 'chlorine' smell, more chance of irritating the eyes, skin, and swimwear, whilst relying on a hazardous chemical (when not diluted). These days people tend to opt for saltwater or mineral water systems to help reduce these effects.

Saltwater

Saltwater systems tend to be softer on the eyes, skin, and swimwear than standard chlorine pools (they use less chlorine and rely more on the salt), and contrary to belief, do not have a strong salty taste like the ocean. They are relatively easy to maintain and work well to sanitise your pool.

Minerals (Magnesium)

Mineral pool systems are becoming increasingly more popular. Like the saltwater systems, they are easy to maintain. They use even less chlorine than saltwater systems and provide some very attractive additional benefits. They are known for being the gentlest on eyes, skin, and swimwear, and are seen to be the kindest option for your pool and equipment. The minerals help remove organic debris and impurities from the water, whilst creating a sparkling water finish with a smooth silky finish. Many people also choose mineral pool systems because of the associated health benefits of magnesium.
